

17" Single Layer Touch Screen

Model 7102

17" Single Layer Touch Screen

This Single Layer Touch Screen has a built-in operating system which allows you to easily program video, images or music by simply downloading them to a compact flash card. You can set the touch screen to feature any one of 10 different layouts, from 1-9 or 16, touch spots. To program simply name your JPEG, MPEG, or MP3 files (00.JPEG -15.JPEG).

The (00.JPEG) file will become the first screen that will be shown before a person makes a selection on the touch screen, then the additional files will determine what content is played once an area on the screen is selected. No special programming software is required once you have your JPEG, MPEG or MP3 content created. For customers that need assistance creating content, we offer content creation and programming as a service at an additional charge.
